

No significant differences were identified between the following sample sets using the following criteria:

Bin size: 0.02 da

t-test, $p = < 0.05$

Intensity = > 0.1

Fold change = > 2

The following data sets showed no significant difference in positive ionisation mode even though slight differences in the PCA plots might be apparent:

NAD2 (Col) vascular tissue

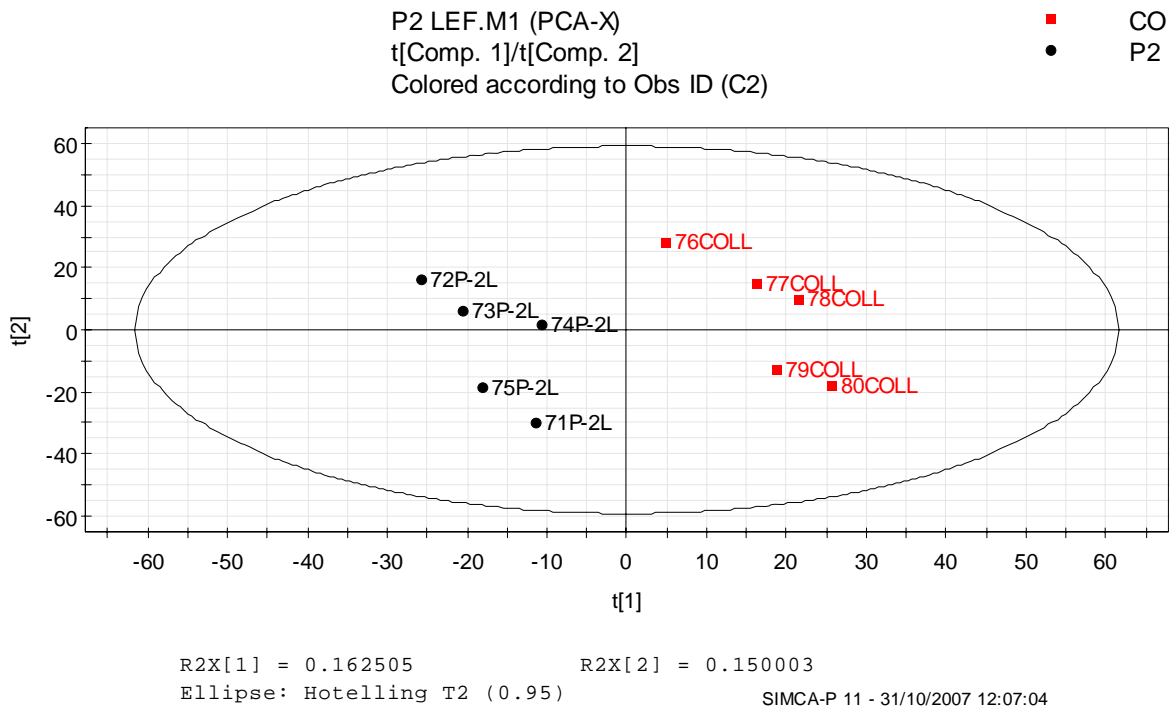

NAD4 (Col) vascular tissue

NADP1 (Col) vascular tissue

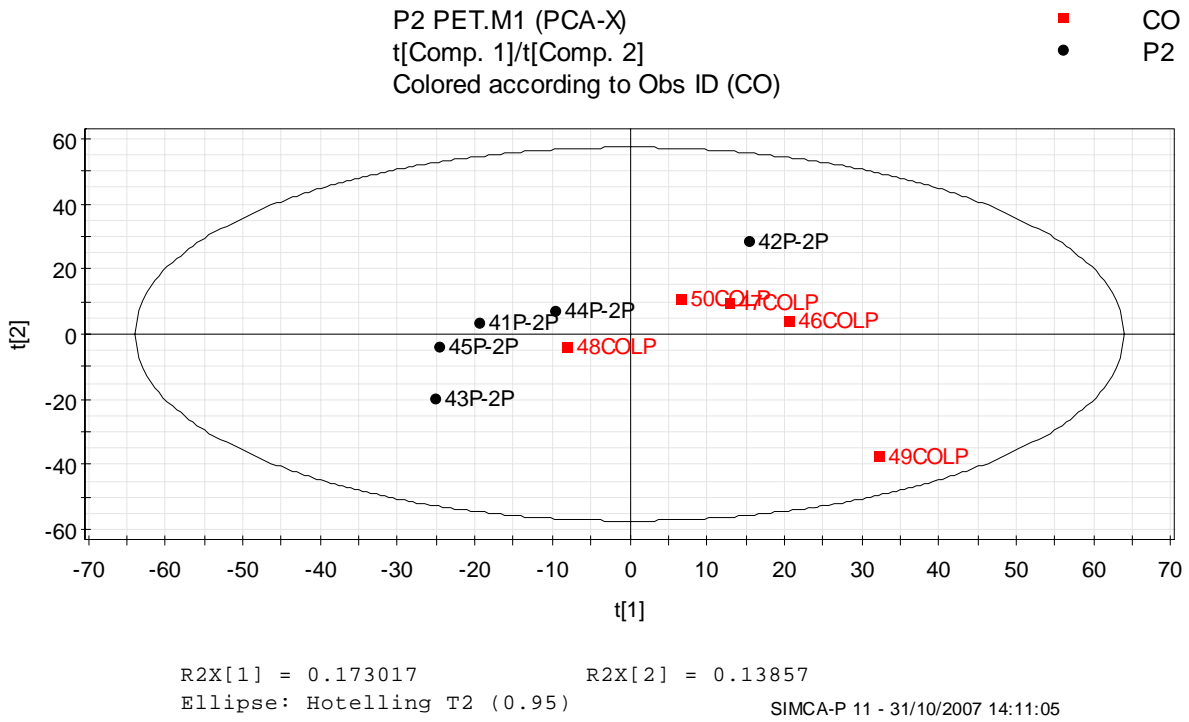

NADP5 (Col) vascular tissue

PEPCK 1-2 (Col) leaf, petiole and vascular tissue

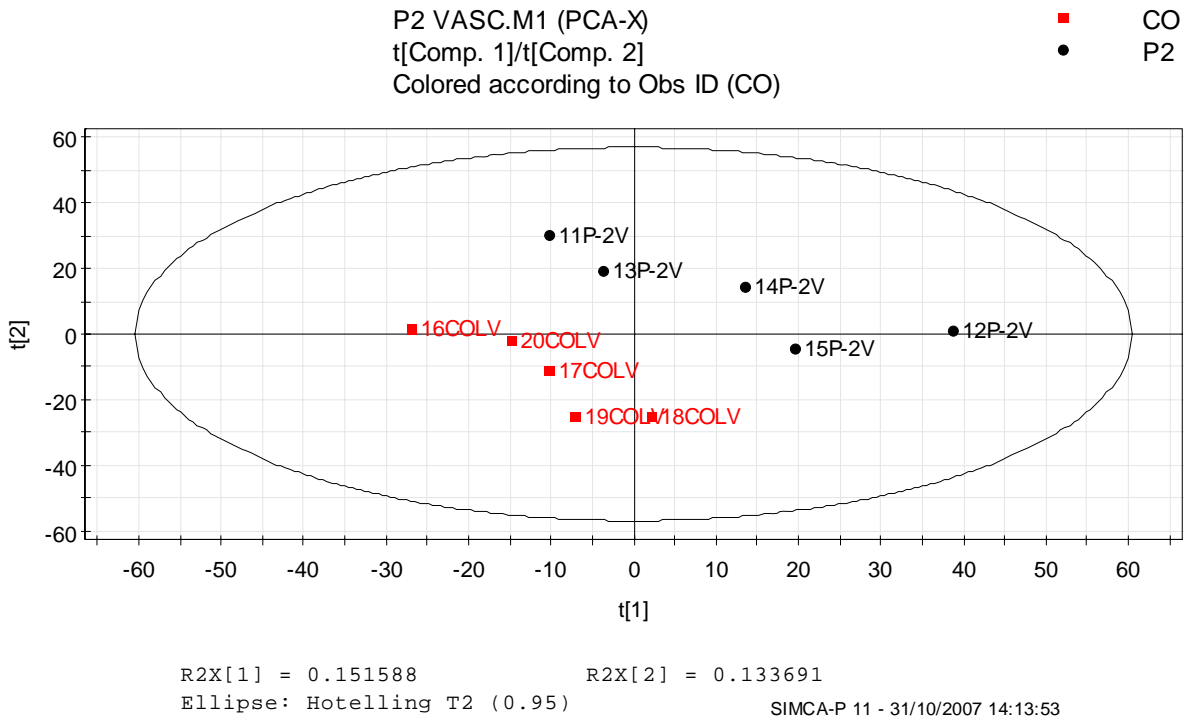

PEPCK 1-2 leaf tissue

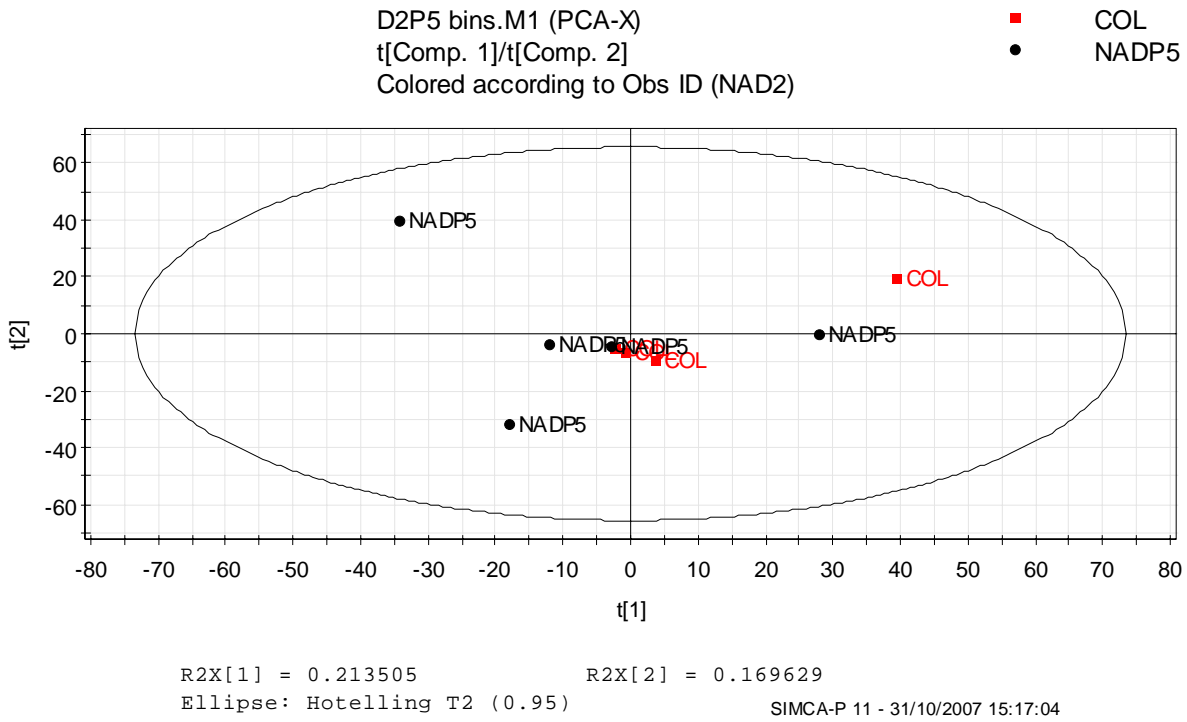

PEPCK 1-2 petiole tissue

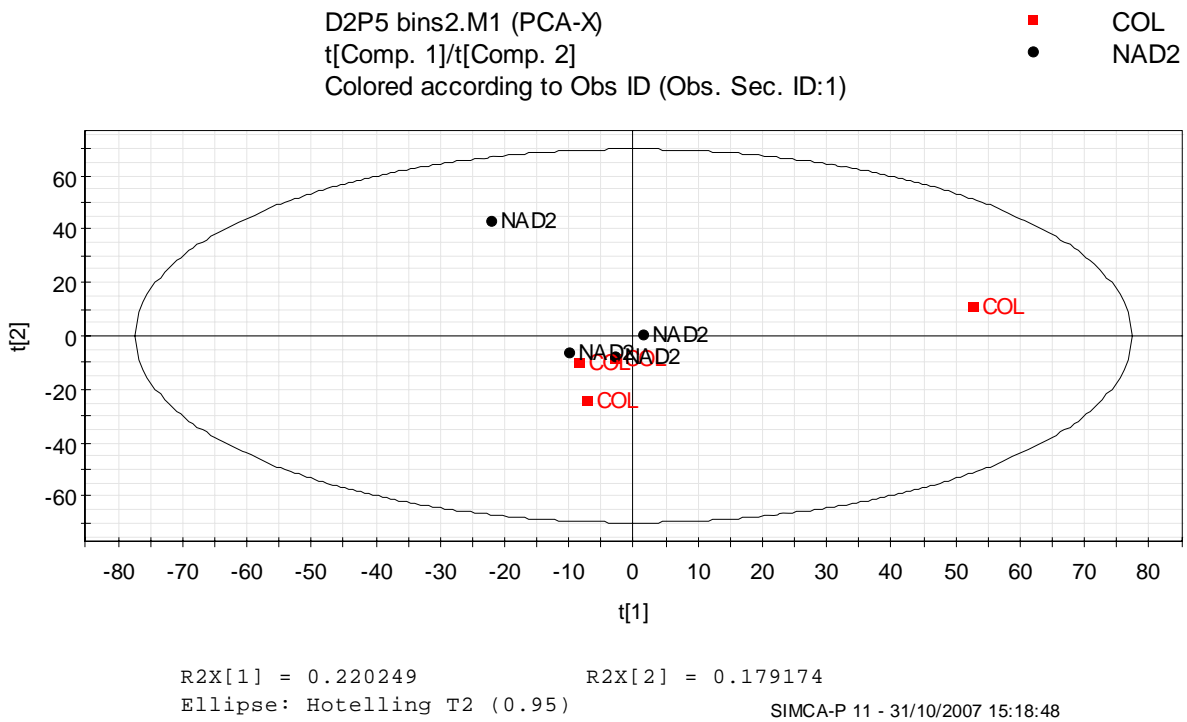

PEPCK 1-2 vascular tissue

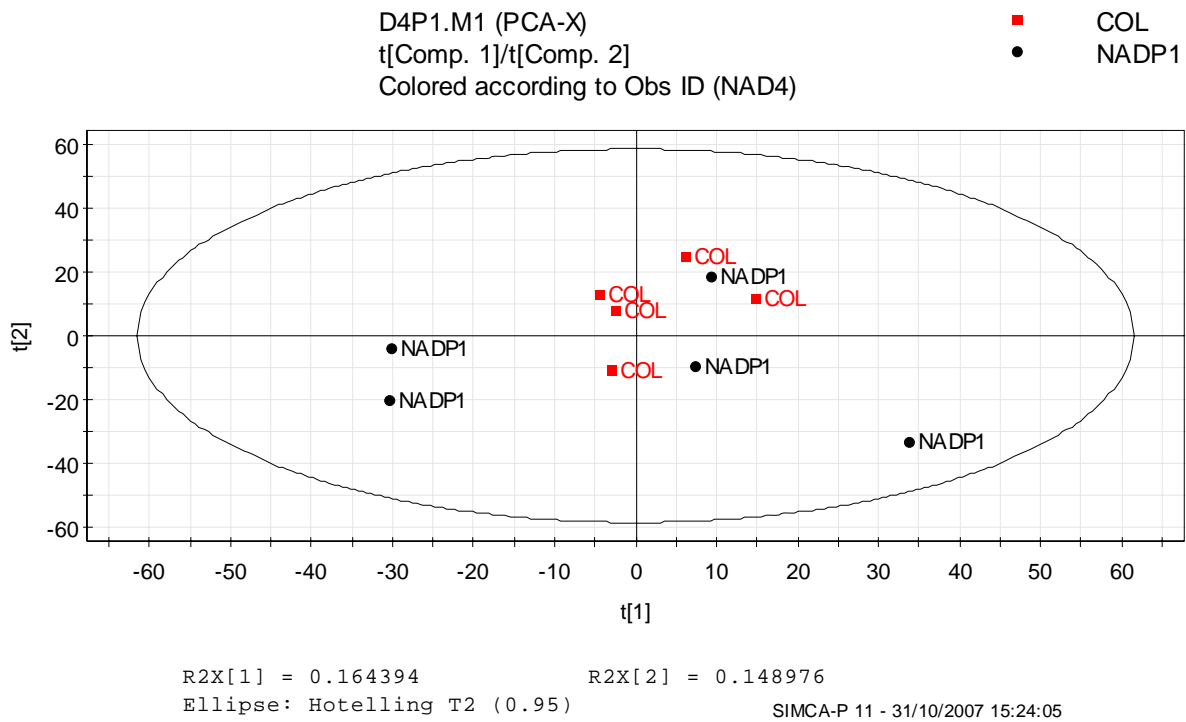

NADP5 vascular tissue

NAD2 vascular tissue

NADP1 vascular tissue

NAD4 vascular tissue
